ORX-2 SENSOR SIDECAR

For all ORX-2 Fixtures with lens
option Sensors are mounted
inside Sensor Sidecar

The ORX-2 when tested without any arms or struts below the fixture aperture, results in 0 measured lumens of uplight above 90 degrees vertical. Any lumens affecting the "U" designation in the BUG Ratings in our standard IES files for the single or double arm post top fixtures, are the result of light bouncing off the support arms located below the fixture aperture. The amount of reflected light over 90 degrees vertical for this style of fixture, is typically between 0.5%-2% of the overall fixture lumens, depending on the fixture design.

Please note:

Manufacturers use different methodologies to evaluate "U0"/uplight. Some manufacturers follow a methodology of removing the data associated with the light reflected off the support arms from their IES test files and lumen charts, to show a "U0" BUG Rating. This practice is based on the view, that if the fixture itself is not directing any light out of the fixture at an angle over 90 degrees vertical, it is not necessary to show those lumen values in the IES files or lumen charts related to that product.

A value as low as 1 lumen of uplight over 90 degrees vertical, will result in a "U1" BUG Rating in an IES file. Our Post Top mounted fixtures are not directing any light out of the fixture at angles over 90 degrees vertical.

The lumen charts below have the data associated with light reflected off the support arms below the fixture aperture, removed from the data. We did test the fixtures without the support arms below the aperture. All of those tests came back U0. Therefore, the lumens and BUG Ratings in the Lumen Charts below are based on the light distribution as it is exiting the fixture, without taking the reflected light off the support arms into account.

IES DISTRIBUTIONS

T2 OPTIC

The Type II distribution is used for narrow pathways and trails, narrow entrances of shopping centers, parking lots and office complex's.

T3 OPTIC

The type III distribution is meant for roadway lighting, general parking areas and other areas where a larger area of lighting is required. Type III lighting needs to be placed to the side of the area, allowing the light to project outward and fill the area. This produces a filling light flow.

Type III light distributions have a preferred lateral width of 40 degrees. This distribution is intended for luminaires mounted at or near the side of medium width roadways or areas, where the width of the roadway or area does not exceed 2.75 times the mounting height.

T4 OPTIC

The type IV distribution produces a semicircular light meant for mounting on the sides of buildings and walls. It's best for illuminating the perimeter of parking areas and businesses. The intensity of the Type IV lighting has the same intensity at angles from 90 degrees to 270 degrees.

Type IV light distributions have a preferred lateral width of 60 degrees. This distribution is intended for side-of-road mounting and is generally used on wide roadways where the roadway width does not exceed 3.7 times the mounting height.

T5 OPTIC - SYMMETRICAL

Type V produces a symmetrical distribution that has the same intensity at all angles. This distribution has a uniform symmetry of candlepower that is essentially the same at all lateral angles. It is meant for large, commercial parking lot lighting as well as areas where sufficient, evenly distributed light is necessary.
